

Section 1

Ch1. Introduction to Database

Slide contents follow

Database System Concepts, 7th edition.

Prepared by:

AbdElrahman Rabea, Eng.

Motivation

Why should we study database?

- Because information are very important
- many application is all about data that is, The central aspect of the application is not a program performing some calculation, but rather the data themselves. (suppose a bank system without its data)
- Databases power a wide range of applications, from banking and healthcare to e-commerce and social media.
- Some application:
 - Social Media Networks.
 - Banking Systems.
 - E-Commerce Platforms

Purpose of database

In the early days, database applications were built directly on top of file systems, which leads to:

- **Data redundancy and inconsistency:** data is stored in multiple file formats resulting in duplication of information in different files
- **Difficulty in accessing data**
 - Need to write a new program to carry out each new task (suppose updating some constraint)
- **Data isolation**
 - Different developer - Multiple files and formats
- **Integrity problems**
 - Integrity constraints become “buried” in program code rather than being stated explicitly
 - Hard to add new constraints or change existing ones
- **Atomicity of updates**
 - Failures may leave database in an inconsistent state with partial updates carried out
 - Example: Transfer of funds from one account to another should either complete or not happen at all

Purpose of database

In the early days, database applications were built directly on top of file systems, which leads to:

- **Concurrent access by multiple users**

- Concurrent access needed for performance
- Uncontrolled concurrent accesses can lead to inconsistencies
- Ex: Two people reading a balance (say 100) and updating it by withdrawing money (say 50 each) at the same time

- **Security problems**

- Ex: Hard to provide user access to some, but not all, data

Exploring the solution

- There exist a solution that solves all of the previous problems.
- Database system: is a collection of interrelated data and a set of programs that allow users to access and modify these data.
- Database: is a collection of interrelated data
- database-management system (DBMS):
 - the software that manages the database.
 - It's primary goal is to provide a way to **store** and **retrieve** database information that is both **convenient** and **efficient**.
 - Ex. Microsoft SQL Server, MySql

Some benefits of DBMS

DBMS Facilitates all of these

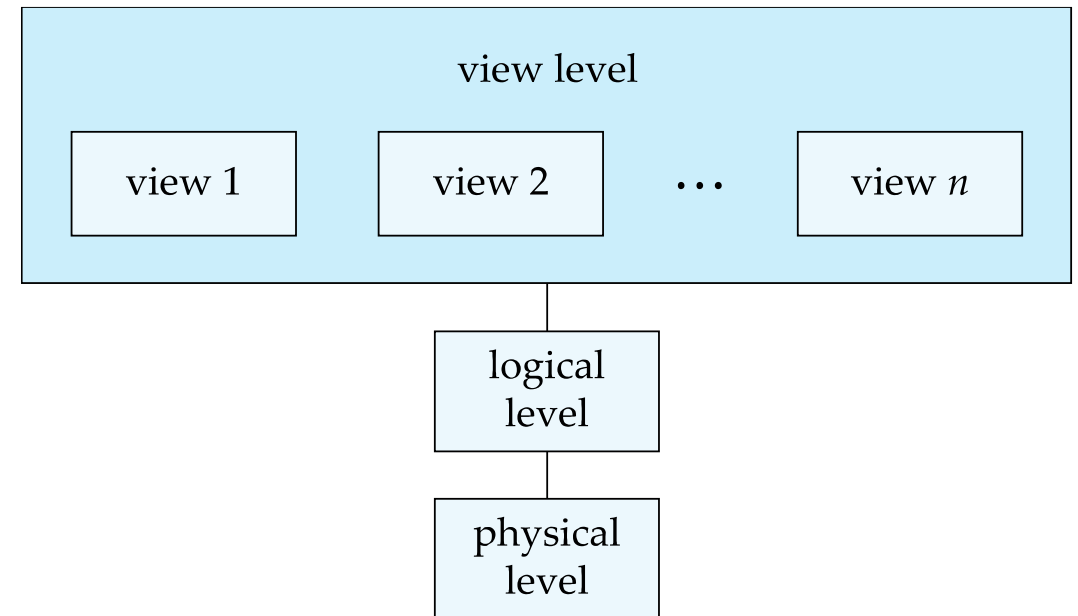

- Data Storage: Stores data in a structured format (e.g., tables in a relational database).
- Data Retrieval: Allows users to query and retrieve data (e.g., using SQL)
- Data Manipulation: Enables users to insert, update, and delete data.
- Data Security: Controls access to the data (e.g., user authentication and authorization).
- Data Integrity: Enforces rules to ensure data accuracy and consistency (e.g., constraints like primary keys).
- Concurrency Control: Manages simultaneous access by multiple users.
- Backup and Recovery: Ensures data is not lost in case of failures.
- provide users with an **abstract view** of the data.
- And much more ...

View of Data and data models

A major purpose of a database system is to provide users with an **abstract view** of the data.

Data abstraction

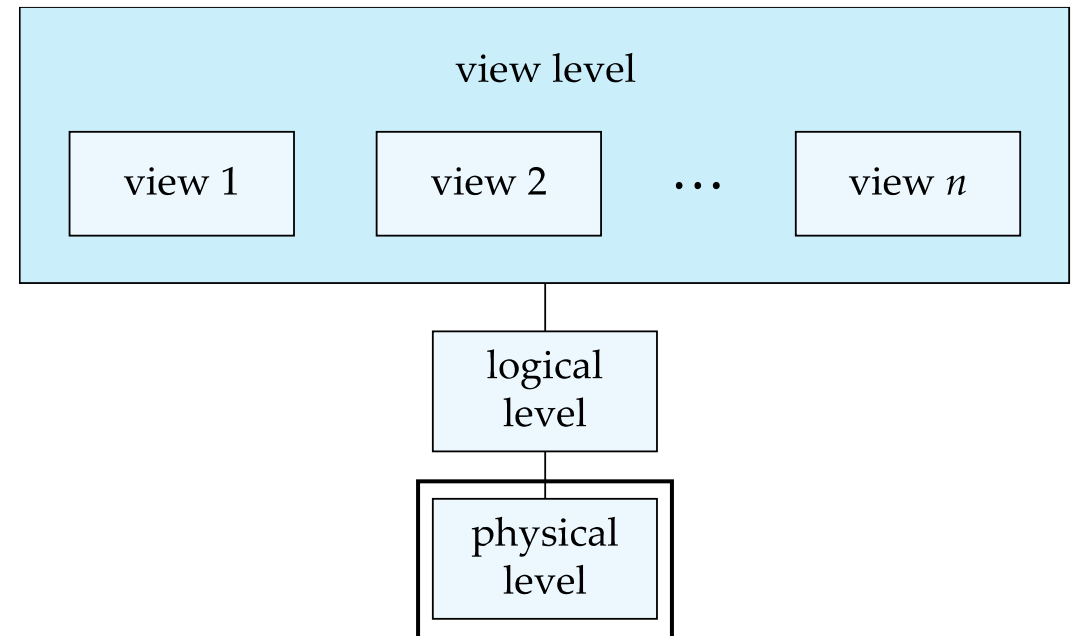

- Hide the complexity of data structures to represent data in the database from users through several levels of data abstraction.
 - Why? For the system to be usable, it must retrieve data efficiently. The need for efficiency has led database system developers to use complex data structures to represent data in the database. Since many database-system users are not computer trained, developers hide the complexity from users through several levels of data abstraction, to simplify users' interactions with the system. **Many benefits will be discussed later.**

View of Data and data models

Physical level

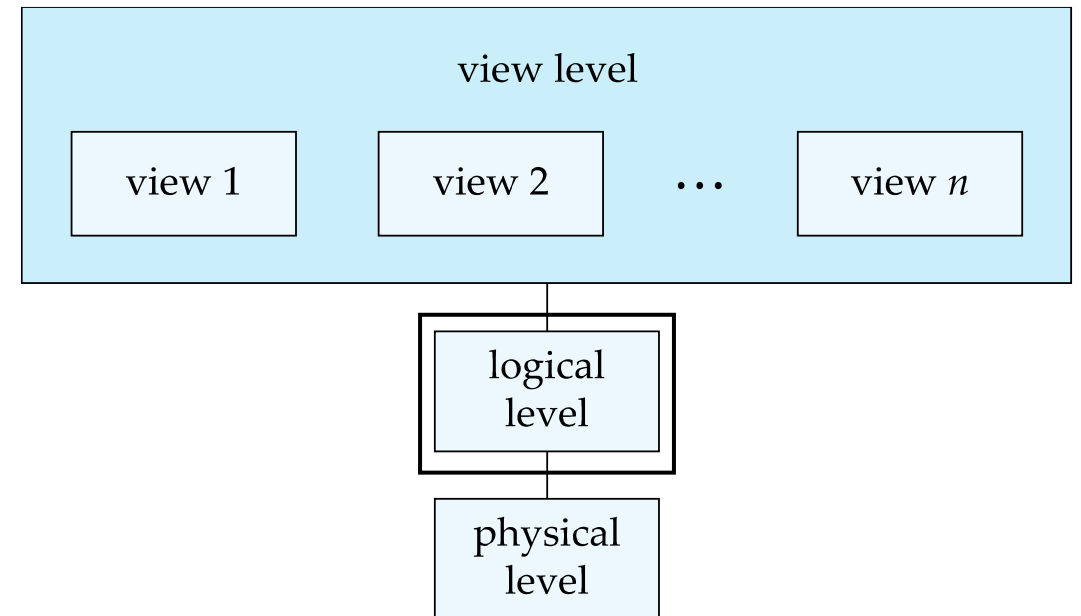

- The lowest level of abstraction describes *how* the data are actually stored. The physical level describes complex low-level data structures in detail.
- Database systems use complex data structures to store and retrieve data efficiently.
 - These structures help manage large datasets, reduce disk I/O, and improve performance.
 - B-Tree Index (For Fast Searching)
 - Hash Indexing (For Fast Exact Match Lookups).
- These complex data structures:
 - ✓ **Improve query performance** (fast lookups, efficient scans).
 - ✓ **Optimize disk space** (efficient storage management).
 - ✓ **Reduce I/O operations** (faster access, less disk reads).

View of Data

Logical level

- The next-higher level of abstraction describes what data are stored in the database, and what relationships exist among those data.
- The logical level thus describes the entire database in terms of a small number of relatively simple structures.
- Although implementation of the simple structures at the logical level may involve complex physical-level structures, the user of the logical level does not need to be aware of this complexity (**physical data independency**).
- Example using **relational model**.

ID	Name	Dept Name	Salary
76766	Crick	Biology	72000

Data model

- A collection of conceptual tools for describing
 - data
 - data relationships,
 - data semantics,
 - and consistency constraints.

Data models types:

- Relational model ([next section in great detail](#))
- Entity-Relationship data model (mainly for database design)
- Object-based data models (Object-oriented and Object-relational)
- Semi-structured data model (XML)

Section scope

- In this course, our focus will not be on the database management system (DBMS) itself, but rather on designing **efficient and well-structured databases** as well as writing queries to retrieve and manipulate data effectively. We will explore how to model data, create relational schemas, and use SQL to interact with databases, rather than delving into the internal workings of a DBMS.

Database design

[More on this later in the course!](#)

- System analysis
- Database design
- Database mapping
- Database implementation.

SSMS 20.2 is the latest generally available (GA) version. If you have a *preview* version of SSMS 20 installed, uninstall it before installing SSMS 20.2. Installing SSMS 20.2 doesn't upgrade or replace SSMS 19.x and earlier versions.

- Release number: 20.2
- Build number: 20.2.30.0
- Release date: July 9, 2024

By using SQL Server Management Studio, you agree to its [license terms](#) and [privacy statement](#). If you have comments or suggestions or want to report issues, the best way to contact the SSMS team is at [SQL user feedback](#).
